

MATH BOMB II

Contents

Introduction	1
Answer Sheet	2
Manual	3
Solutions	11

Welcome to MATH BOMB. This is a fun, interactive mathematics experience where students defuse a bomb. This package includes 4 components:

1. Bomb Video: The bomb video can be found at [this link](#). The timer is set at 40 minutes. The activity can take shorter or longer depending on the group of students you are working with.
2. Answer Sheets: Has prompts to guide students through the bomb defuse.
3. Manual: Printable instructions to defuse the bomb.
4. Solutions: A filled in answer sheet for reference.

This bomb is intended for grade 6-9 students, but can also work for gifted grade 2-5 students or as a fun activity for grade 10 and above students. Below is a brief description of some mathematics concepts that are required to defuse this bomb:

- Counting # of divisors a number has.
- Logic and reasoning.
- Angles of rotation.
- Number sequences.

On the sides of the bomb, there are several red buttons. You must press down **ALL** the buttons with an even number of positive divisors.

There is also a keypad on the bomb that requires you to enter three unique codes in succession. Follow the directions below:

1. Green Buttons ♠ — Spa + SC + Opposite of beginning
2. 13, I, II, III, IV, V
3. Draw an arrow from σ to 77. $180^\circ \curvearrowright$. $90^\circ \curvearrowleft$. $180^\circ \curvearrowright$. $90^\circ \curvearrowright$.

There are five turnable dials on the bomb. Dial I should be set 90° East of North. The instructions below indicate the positions of the four other dials.

1. Dial II should be turned \square° \curvearrowright past the position of dial III.
2. Dial III Should be turned \triangle° \curvearrowright of dial I.
3. Dial IV points 90° \curvearrowright of Dial V
4. Dial V points 270° \curvearrowright of Dial I.
5. \triangle is half of \square .
6. \square is a quarter of a full rotation.

There is a 5×5 grid of green buttons enclosed by colourful cages on the bomb. To deactivate this component you will have to press the green buttons so that the following rules apply:

1. There is only one green button pressed in each row, column, and colourful cage.
2. Adjacent buttons cannot be pressed. Adjacent buttons are ones that are *next* to each other (even diagonally).

There is a 5×5 grid of plug-ins and colourful regions on the bomb. To deactivate this component of the bomb you will need to connect the right plugs with wires so that the following holds:

1. Only connect plugs that are adjacent (not including diagonally).
2. Do not connect plugs within the same region.
3. There must be the *correct* number of plugs in each row/column.
4. Each region is connected exactly once to all of its neighbouring regions.

An example schematic is shown below if there is any confusion:

There is a 5×5 grid with several numbers labelled, but many missing. Each row and column of the grid forms an *arithmetic sequence*. A sequence is arithmetic if each term after the first is obtained by adding the same constant to the previous term. For example: 2,4,6,8,10 is an arithmetic sequence.
